Development Brief

What to design and build for the Lambeth pilot, and how to know it is done

Version	1.0
Date	30 September 2026
Status	DRAFT
Owner	Product & R&D, for David Morris

> **DRAFT, for David Morris to accept or amend. This is the commission for design and build. It is not the schedule. If documents disagree: Decisions_Log_CURRENT_v2 wins, then this brief, then Development Plan v1.0 for sequence, then Feature Register v1.2 for IDs. Master Prompt v2.1 is background. Where this brief is silent, v2.1 applies only if a later decision has not overridden it. Not legal, tax or payments advice.**

1. How to use this brief

This brief tells a designer, an engineer or an agency what The Common is, who it is for, what must be true at the Clapham soft launch, and what must be left out. Read it before opening the master prompt. The master prompt is a critique and a full specification. Used on its own, it will cause the team to build the product that was deliberately cut.

Document	Use it for	Do not use it for
This brief	What to design and build, and the acceptance test	Dates, staffing and the week-by-week plan
Development Plan v1.0	Sequence, slices, launch gates, risks	Changing a requirement
Decisions Log v2	A decision that has already been made	Feature detail
Feature Register v1.2	Stable IDs (F01–F72) and phase	A second description of behaviour
Pilot Brief v1.1 and Pilot Plan v0.3	Personas, discovery and how the pilot is run	Build scope, where this brief is newer
Master Prompt v2.1	Background, entities and the original MUST list	Scope. Several of its MUST items were later moved to Wave 2
Branding Guidelines v1.0	Logo, colour, type and voice	Product behaviour

Words in this brief are used strictly.

- Must: the launch is not acceptable without it.
- Should: do it in Wave 1 unless discovery or Stage 0 sign-off removes it, and record the reason.
- Design for: do not build it in Wave 1, but do not make a choice that forces it to be rewritten.
- Not now: phase 2, phase 3, or an item rejected for the pilot. Do not design screens for it.

2. The commission

Design and build the first release of The Common, a mobile-first web app for neighbourhood life, and prove it in Lambeth. Residents use it free, including as guests. Local businesses, organisers and community groups pay to be found and to publish offers

and free events. The company is THE COMMON COMMUNITY. The brand is The Common. The public address is thecommon.community.

The first release is Wave 1, soft-launched in Clapham, then repeated in Brixton, Vauxhall and Herne Hill from the same product. Wave 2, about six to eight weeks after launch, adds paid ticketing, promotional push, table-booking requests, the full inbox and AI-assisted moderation. Those are specified here only as design constraints. They are not part of the launch commission.

The pilot exists to answer two questions. Will residents use this instead of Google, Instagram and Facebook to find what is nearby? Will a business pay £10 a month after a 30-day trial? A feature that does not help answer one of those questions is not in Wave 1.

3. Problem and outcome

Local businesses, groups and organisers are hard for neighbours to find. Residents piece together social feeds, search results and council pages. Information is out of date, and it is hard to know what to trust. National tools are not built around one neighbourhood, and many feel noisy. Small organisers do not want a ticketing product designed for large venues.

The outcome of Wave 1, if it succeeds, is all of the following.

- A guest can open a shared link and see what is on, what is offered and who is open in Clapham, without an account, in under a minute.
- A business with no web developer can claim or create a page, be checked by a person, and publish an offer and a free event.
- That business can see views, clicks, directions and follows, which is the evidence for paying £10.
- A resident with an account can follow places, save items, hold a free ticket that works with no signal, and be checked in by QR.
- Nothing goes live that a person has not approved, except a class of low-risk content that an administrator has explicitly trusted.
- A second area can be turned on by configuration, not by a new codebase.

4. Users

These are hypotheses. The discovery sprint (ten to fifteen Clapham businesses and a resident survey of 150 or more) must mark each one confirmed, changed or rejected before Stage 0 is signed off. Do not treat the names as research.

User	Job to be done	Wave 1 is acceptable when
Resident, “Amira”	Find something good, trusted and nearby, and come back	She can do it as a guest, then follow and save. She is not asked to create an account to look.

User	Job to be done	Wave 1 is acceptable when
Business owner, “Dev”	Be found, and publish an offer, without a developer	A real café can reach “submitted for review” in one sitting, and can see four numbers: views, clicks, directions, follows.
Organiser, “Jo”	List a small event, cap the room, and check people in	Free RSVP only at launch. QR check-in works offline. Paid tickets are not required for her first event.
Charity or community group	Reach neighbours at low cost	The £5 price and the same page, offer and free-event tools. No separate product.
Moderator and borough admin	Keep the area accurate and safe	A queue shows what is waiting, how old it is, and who decided. Median approval under one working day.
Council (later partner)	Put official information where residents already look	Not a user of Wave 1. Official RSS and the services directory are the only council-facing behaviour.

Browsing is open to everyone. Creating an account, following, saving, messaging, holding a ticket or publishing is 18 and over. Age is a declaration at sign-up, not a hard identity check, unless the children's access assessment says otherwise.

5. Product principles

- Local. Everything is organised by neighbourhood and borough, not by a national feed.
- Trusted. A person reviews a business before the Verified badge appears. The badge says only what was checked.
- Simple. A busy owner can finish set-up in one sitting. A resident can understand a page in a few seconds.
- Plain. AI may suggest. AI may not invent a price, an hour, an award, a qualification or an accessibility claim. The owner approves every factual field.
- One product. A new area is data and settings. It is not a new app.
- Money is separated. Subscriptions never share a ledger with ticket money. In Wave 1 there is no ticket money.
- Soft delete. Records are archived. Personal data is erased or anonymised on request. Financial and safeguarding records are kept for their retention period.
- Family-friendly means moderated and age-gated, not a claim that the service is safe for children to hold accounts.

6. Decisions that override the master prompt

v2.1 was written on 29 September 2026. The decisions below were made on 30 September 2026. Build to this table, not to the older MUST, where they differ.

Topic	v2.1 said	Build this
Trial	Founding period, length unset in the prompt; later drafted as three months	30 days. Starts at sign-up on that area's go-live. Card required, except a recorded Admin waiver for a hand-picked partner.
Charity price	Free or low-cost, eligibility unset	£5 a month for registered charities and religious organisations. Sports and social clubs only by admin discretion.
Ticketing	Paid and free in the pilot	Free RSVP, capacity and QR check-in in Wave 1. Paid tickets in Wave 2, after advisers sign off Stripe Connect.
Inbox	A full inbox with staff assignment	An enquiry form in Wave 1. Staff assignment in Wave 2.
Bookings and push	Table requests and capped push in the pilot	Wave 2. The notification service must already support caps and quiet hours.
Moderation AI	Pre-screen in the pilot	A person moderates at launch. AI recommends only from Wave 2. The AI boundary is still built in Wave 1 so the vendor can be added without a rewrite.
News	RSS, licensed feeds, and a path to scraping	Official and public sources, plus hand-picked stories. No scraping. Headline, short excerpt, link out.
Maps	Maps required; provider unset	OpenStreetMap. Not Google Maps.
Verified	Criteria were an example	Email, phone, confirmed address, Companies House number or proof of trading for a sole trader, recorded human review, public explanation, re-check every 12 months.
Areas	Lambeth, three or four neighbourhoods	Clapham first, then Brixton and Vauxhall, Herne Hill last. Many-to-many geography from the first release.

7. Scope

7.1 Wave 1, which this brief commissions

Area	Must be in the launch	IDs
Residents	Guest browse, feed, search, maps, 18+ accounts, follow, save, weekly digest, reminders, offline ticket wallet, install prompt	F01–F08
Businesses	Claim or create, guided set-up, verification, public page, offers, completeness, basic counts, enquiry form, QR kit, till redemption, share previews, SEO	F10–F13, F15, F16, F27–F29
Events	Create, capacity, safety attestation, free RSVP, signed QR, offline wallet, door check-in, map, expiry	F30–F35, F06, F07, F33

Area	Must be in the launch	IDs
Money	Stripe Billing, £10 and £5, trial, card, waiver, reminders, retry, pause, subscription view	F22–F25
Local information	Approved news, services directory, concern guidance with a 999 notice	F50–F53
Trust	Report and block, manual queue, audit log, abuse controls, analytics for the pilot measures	F60–F64, F69, F72
Gates	Online Safety Act assessments, privacy pack, security baseline. These are acceptance gates, not backlog	F68, F70, F71

7.2 Design for Wave 2, and do not build

The data model and navigation must leave room for these. Do not ship the screens, and do not take a shortcut that blocks them.

- Paid tickets on Stripe Connect, organiser as merchant of record, 10% application fee, all-in price, refunds, payouts and a ticket ledger separate from subscriptions (F31, F36).
- Promotional push: at most two a month per business, admin approval, no send between 21:00 and 08:00 (F20, D12).
- Table-booking requests, then later live availability (F18, F19).
- A full inbox with assignment to staff (F14).
- AI pre-screen with reason codes, and automated image classification (F61, F69). A person still decides.
- Unique offer codes, a monthly value email, and a content-health view (F28, F17, F65).

7.3 Not now

Reviews, marketplace products and services, and giveaways are phase 2. Accommodation, jobs and CVs, sending a report to the police, natural-language search, loyalty, volunteering, fundraising and council consultations are phase 3. Native apps are not in this commission. Do not add screens, tables or navigation for them "while we are here".

8. Experience, brand and content voice

Design the resident experience first. v2.1 is explicit that the resident side was the thinnest part of the original prompt and is the part the business model depends on.

- Mobile first. The public site is a progressive web app. The admin console is desktop first.
- Light mode is the default. Dark mode may wait. Colour is Forest Green (#003820) for structure and text, Sun Gold (#F8B830) for a primary action only, Off-White (#F8F8F8)

for the page. Body text is #1A2E24. Type is Inter, with Segoe UI or Roboto only if Inter cannot load.
- The logo is the plain “THE COMMON / Our place, our people” mark. Do not use the superseded Clapham variant. Do not recolour or redraw the mark.
- Voice is a neighbour, not a platform. Say “nearby” and “on your doorstep”. Do not say “leverage”, “ecosystem” or “AI-powered”. Do not claim “fully verified” or “100% safe”.
- Plain English. Build so a later translation can be added without rewriting the interface. Do not translate in Wave 1.
- Show real neighbourhood photography only with permission. Do not fill the pilot with generic stock.
- Accessibility is WCAG 2.2 AA: keyboard, screen reader, contrast, resizable text, and errors that are written out, not signalled by colour alone.

9. Journeys and acceptance

Each journey is accepted only when the matching demonstration can be done on a phone, on a real Clapham record, by someone who did not build it.

9.1 Resident, from a shared link

- Opens a business or an event with no account. Sees what it is, where it is, and how to get there.
- Sees a map and directions. The map is OpenStreetMap.
- Can create an 18+ account, choose Clapham, follow the business and save the event.
- Can turn the weekly digest on or off, and can unsubscribe in one step.
- Sees only content that is published. Drafts, rejected items and other areas' private records are not in the page or the HTML.

9.2 Resident, at the door

- A free RSVP issues one ticket with a unique ID and a signed QR code, in the account and by email.
- The QR opens with the phone on airplane mode.
- Door check-in scans it, counts attendance, and flags a second scan. Check-in also works by name if the code will not scan.
- When the event is full, a further RSVP is refused. An administrator cannot silently raise capacity. An increase needs the organiser's reason, an authorised approval and an audit entry.

9.3 Business, from first contact to day 30

- Finds a pre-seeded listing, or starts a blank one. Claims it by a call to the listed number, a domain email, or a postcard, then completes verification.
- A lookalike or a second claim raises a dispute. It does not replace the existing owner.

- The wizard saves and resumes. AI suggestions are labelled. Prices, hours, awards, qualifications and access claims stay empty until the owner types them.
- Submits and can see the status at all times: Draft, Submitted, Pending Review, Changes Requested, Approved, Published, Expired, Archived, Rejected, Suspended.
- After approval, the public page shows description, services, hours, access information, place, contact, offers and events. Products, bookings and reviews are not on the page.
- An offer can be redeemed by “show at till”, and the redemption counts. A QR sticker scan counts as a view or a scan on the same dashboard.
- The dashboard shows views, clicks, directions and follows. It does not show ticket revenue.
- A card is taken at sign-up. The first charge is on day 30, after reminders on day 23 and day 28 that state the date, the £10 and how to cancel. A failed charge retries for seven days, then the page comes down. Existing free tickets stay valid and can still be checked in.
- A waived partner has no card. Admin has recorded the business, the reason, the approver and the date. Day 30 does not charge them. A later admin decision asks for a card, and billing starts only when that card is added.

9.4 Organiser, free event

- Creates an event with place, time, capacity, access information, age note and a safety attestation: permissions, licence and insurance, as applicable, are in place.
- Shares a link with a preview that works in WhatsApp and iMessage.
- Sees issued, remaining and checked-in. Does not see a payout, because no money moved.
- After the event, it leaves the live feed and remains in the owner's history.

9.5 Moderator, one working day

- Opens a desktop queue of businesses, events, offers, news and reports, filterable by area, type, status and age.
- Can approve, request changes, reject, suspend or archive. Every action records the person, the time and the reason. Nothing is hard-deleted.
- A report records the reporter, the content, the reason, the reviewer and the outcome. Target: closed within two working days.
- News does not publish itself. A trusted source may be configured later. For the pilot, a person approves news.
- An image sits in the queue for a person. There is a written route for child sexual abuse material and terrorism content. The product does not make that judgement itself.

10. Functional requirements

These are the Wave 1 rules. IDs point at the register. They are not extra scope.

10.1 Discovery and accounts

- Must let a guest browse businesses, offers, events, news and services for a chosen neighbourhood, as a feed and as a list with a map.
- Must filter by category, date, distance and accessibility where those fields exist. Family-friendly is a filter only when the content has been marked, not a guess.
- Must give each published business and event its own addressable page, server-rendered, with schema.org markup, a canonical URL and a sitemap entry. Border places have one canonical borough and may appear in a second area's discovery.
- Must let an 18+ resident follow a business, save an event or an offer, and manage those from the account.
- Must send an optional weekly digest and a reminder before a saved or booked event, with an “add to calendar” file. Quiet hours, caps, bounce handling and unsubscribe are part of this service even though push marketing is not.
- Must provide account export and deletion, and must record marketing consent per channel.

10.2 Business page and offers

- Must run one lifecycle for every reviewable object, as listed in the business journey.
- Must show a completeness score and name the missing fields. The pilot target is 80% of live businesses at or above 80% complete. The score is a product rule, agreed at Stage 0, not a feeling.
- Must include access fields: step-free access, hearing loop, and a free-text note. Empty means “not stated”, never “accessible”.
- Must support a time-limited offer with a till redemption that counts, and a printable QR for the window or the counter.
- Must attribute shared links so a scan or a visit can be shown on the dashboard.
- An enquiry is a form to the business, visible to the owner, with spam and link controls. It is not a mailbox product.

10.3 Claim, verification and anti-impersonation

- Must seed listings only from sources whose licence allows it. Food Standards Agency ratings and Companies House are the starting sources. OpenStreetMap geometry may be used for the map; copying OSM business records into our database needs a licence check before import.
- Must verify with the D15 standard, store the reviewer's name and the date, and show a public page that says what Verified does and does not mean.
- Must re-check every 12 months, and must re-verify if phone, email, address, website or payout details change.
- Must detect a duplicate or a lookalike name at the same or a nearby address and hold it for a person.

10.4 Events

- Must capture title, description, image, venue, address, neighbourhood, start and end, capacity, accessibility, age note and the organiser's attestation.
- Must stop RSVPs at capacity and archive the event after it ends.
- Must sign the QR so a copied screenshot of an old code fails. Rate-limit RSVPs so one person cannot empty a free list.
- The check-in screen is a separate, simple phone view for door staff. It is not the admin console.

10.5 News, services and the concern hub

- Must store each source with name, feed address, geography, trust level, licence and last success or error.
- Must publish headline, a short excerpt and a link to the original. Must not republish a full article or an unlicensed image.
- Must show, on every service, the source, the owner and the date last checked, plus a notice: not for emergencies, call 999.
- The concern hub points to official routes only. It does not upload evidence to the police and it does not store an incident report as if it had been sent.

10.6 Admin, audit and areas

- Must require two-factor authentication for every platform role and for the organisation Owner, with session timeout and a visible login history.
- Must scope every query by tenant. An automated test must fail the build if a Lambeth administrator can read another tenant's records. There will be only one live tenant at launch. The test exists anyway.
- Must keep an append-only audit log of approvals, rejections, suspensions, role changes, capacity changes, waivers, billing exceptions and AI overrides.
- Must create an area by configuration: name, neighbourhoods, administrators, sources, prices and feature flags. Brixton is not a branch of the code.
- Should open the console on what needs a person today: the queue, failed payments, and broken feeds. Sample numbers from old mock-ups must not be hard-coded.

11. Roles

Platform roles and organisation roles are different lists. Do not collapse them into one “admin”.

Role	Family	At Clapham launch
Super Administrator	Platform	Must. Owns waivers, area settings and the fee-paying decision for a waived partner.

Role	Family	At Clapham launch
Borough Administrator	Platform	Must. Scoped to Lambeth, and later to one primary borough.
Moderator	Platform	Must. Works the queue. May be the same person as the borough administrator at the start, but the permission is separate.
Finance Administrator	Platform	Must. Sees subscriptions, failures and waivers. Does not see a resident's full enquiry text.
Content Administrator	Platform	Must for news and services. May be combined with Moderator at the start.
Support Agent	Platform	Should. Read-mostly, and every view of personal data is audited.
Owner	Organisation	Must. One per business. Two-factor. The only person who can change payout details later.
Staff	Organisation	Should. Can check people in and see enquiries the owner has shared. Cannot change billing.
Event Manager and Finance	Organisation	Design for Wave 2. Do not build separate products for them now.

Least privilege. No shared logins. A permission change is logged. High-risk actions, including suspension, a capacity override and a waiver, ask the signed-in person to confirm again.

12. Geography and data

- An Area has a type: country, region, city, borough or neighbourhood. A neighbourhood may relate to more than one borough.
- Every business, event and article has coordinates or a postcode, one primary borough for governance, and optional secondary boroughs for discovery. A Clapham address in Wandsworth is administered by the borough the address falls in, and may still be discovered from Clapham.
- Neighbourhoods are curated names, not official boundaries. Say so where a resident might think otherwise.
- Do not publish population, business counts or financial estimates from the London Research workbook. They are unverified. The import of that workbook waits for a written validation report.
- The Clapham launch needs a ward and postcode list, agreed before any listing is imported, and a repeatable import for the next area.
- Core records, even if some stay empty until Wave 2: Tenant, Area, User, Consent, Organisation, Organisation Member, Subscription, Plan, Offer, Event, Ticket, Follow, Enquiry, Report, Article, Content Source, Local Service, Notification, Policy Version, Audit Log, Feature Flag. Order, Ledger, Payment, Refund and Payout exist as types so

ticket money is not later forced into the subscription tables. Listing, Review and Booking are not created as live features.
- Every record has an ID, timestamps, owner, status, tenant and geographic references. Retention and soft-delete fields sit on the records that need them.

13. Payments behaviour

Wave 1 takes subscription money only, through Stripe Billing, using Stripe Checkout or Elements so card numbers never touch our servers. Webhooks are signature-checked and idempotent. Keys are restricted.

Rule	Behaviour
Prices	£10 a month for a business. £5 a month for an eligible charity. Residents pay nothing. Prices are configuration with an effective date, not constants in the interface.
Trial	30 days from go-live sign-up. Reminders on day 23 and day 28. First charge on day 30. Copy is checked for consumer law before it is sent.
Waiver	Admin records business, reason, approver and date. No record, no waiver. No automatic conversion.
Failure	Retry for seven days. Notices go to the owner. Then deactivate. The page may stay visible until the paid period ends. No new ticket sales while paused. Wave 1 has no paid sales; the rule is still implemented for free events so Wave 2 does not invent it.
Separation	A subscription charge never appears as event revenue. The Wave 1 finance view shows subscriptions, invoices, failures and waivers only.
Refund of our fee	On a ticket, later: the 10% is returned if the failure is ours, and kept if the buyer cancels. Not built in Wave 1. Do not write the opposite into the data model.
Who pays Stripe	Unsettled. Do not hard-code a bearer. Leave it as configuration, defaulting only after the adviser signs.

14. Trust, privacy and security

These are launch gates. A finished interface with these undone is not the release.

- Online Safety Act: an illegal-content risk assessment scoped to Wave 1, a children's access assessment, a named accountable person, and the matching disclosures in the terms. An adviser reviews them.
- Privacy: a DPIA and a record of processing; resident, business and organiser terms; a privacy and cookie notice; a complaints form that acknowledges within 30 days; export and erasure that actually delete or anonymise; one retention schedule with jobs that enforce it.
- Security: OWASP ASVS Level 2 as the test bar; a vulnerability disclosure route and security.txt; an incident runbook that includes the ICO's 72 hours, rehearsed once; encryption in transit and at rest; hashed passwords; rate limits; upload scanning; EXIF and location stripped from public images; the feed fetcher unable to reach internal

addresses; secrets out of the repository; dependency scanning; a penetration test before launch.
- Abuse: a privacy-friendly check at sign-up, disposable-email blocking, per-endpoint rate limits, RSVP hoarding limits, and spam controls on the enquiry form. Report, block and a two-way block.
- Safeguarding: a named lead, a same-day escalation route, and preservation of evidence. The product supports the procedure. It does not replace the person.
- AI, when used for onboarding copy: behind one interface, so the vendor can change; usage and cost logged; no training on our data; a data-processing agreement in place; a human fallback when the vendor is down. Suggestions are labelled. Factual claims are not generated.
- Production personal data does not go to laptops or to staging. Tests use synthetic data.

15. Non-functional requirements

These targets come from v2.1 section 17. They are proposed. Stage 0 confirms them. They are not optional wording.

Area	Target
Public pages	75th percentile Largest Contentful Paint under 2.5 seconds on a mid-range phone on 4G.
Search	Results in under a second at the load expected for one borough.
Availability	99.9% in a month for the public site, sign-up and billing. A status page exists.
Recovery	Recovery point within 15 minutes. Recovery time within 4 hours. One restore is rehearsed before launch.
Scale	Built for one borough, structured for at least 33 tenants. Load-test a free-event rush even though payment surges come later.
Separation	Development, staging and production are separate. A deploy to production is a deliberate act.

16. Technical constraints

The brief does not choose a framework. Stage 0 proposes a stack in a short note, with the reason and the alternative rejected, against a team of one or two engineers. The following are constraints, not suggestions.

- One codebase, one API, one public app. Separate interfaces for the public site, the business tools, door check-in and the admin console. They are modules, not services. Do not start with microservices.
- API-first. The public pages are server-rendered for guests, search engines and share previews.

- A borough is a tenant enforced in the database, with a test that crosses the boundary.
- Maps use an OpenStreetMap-based stack.
- Payments use Stripe. No second payment provider in the pilot.
- Email is sent as thecommon.community, with SPF, DKIM and DMARC. The provider is chosen at Stage 0.
- Feature flags can turn an area, a price and a Wave 2 module on without a release branch per neighbourhood.
- An AI coding agent may implement a slice. It is given this brief and the relevant feature IDs, not the whole master prompt, and not production data.

17. What “done” means

17.1 Stage 0 deliverables, before build is signed off

- A clickable prototype of the resident feed and of claim-and-onboard, using the brand tokens, tested with at least five of the discovery participants if they agreed to a follow-up.
- The screen list for Wave 1, and an explicit list of screens that were refused.
- The permission matrix filled with named people, not role titles alone.
- The data model, the Clapham postcode and ward list, and the licence note for every seed source.
- The architecture note, including how a second area is switched on, and how ticket money will stay out of the subscription ledger.
- A threat model, the DPIA draft, and confirmation of the non-functional targets.
- Discovery synthesis filed, with each persona marked confirmed, changed or rejected.
- David's written sign-off. Without it, Wave 1 build is not authorised.

17.2 Wave 1 is accepted only when

- The five journeys in section 9 have been demonstrated on a phone, on Clapham data, by someone who did not build the slice.
- The launch gates in the Development Plan are true: entity, ICO, insurance, VAT position, published policies, named moderator and safeguarding lead, Stripe trial tested, at least ten verified founding businesses, news and services loaded, and David's go or no-go.
- The automated tenant-isolation test, the restore rehearsal and the penetration test are done, and the unresolved findings are written down with an owner.
- A new area can be configured in staging and a test business published there without a code change.
- No Wave 2 or phase 2 screen is reachable from the public navigation.

18. Measures the product must be able to report

These are the provisional pilot targets. The product must be able to compute them. It does not have to hit them for the build to be accepted. Hitting them is an operating question.

Measure	Provisional target	When
Verified businesses in Clapham	At least 10 at launch; 75 across four areas	Launch, and month 3
Profiles at least 80% complete	80% of live businesses	Month 3
Monthly active residents	1,500	Month 3
Come back within 30 days	30%	Month 3
Follows per active resident	3 or more	Month 3
Paid conversion	50% of the cohort	Day 30
Churn after conversion	Under 5% a month	Ongoing
Approval time	Median under one working day	Ongoing
Reports	Closed within two working days; no open safeguarding item	Ongoing
Month-12 floor	172 paying businesses	Month 12. Below this, the pilot is reviewed. The 17,200 figure behind it is not shown in the product.

19. Points this brief does not decide

- The framework, host and database, within the constraints in section 16.
- The email-sending provider.
- Who bears Stripe's processing fee, the Connect account type, chargeback exposure and VAT. Adviser work. Configuration, not a guess in code.
- Whether the City of London is ever in scope. Irrelevant to Lambeth.
- The Stage 0 time-box, the budget and the named team. Those sit in the Development Plan and are still open.
- Whether discovery will change a persona or the card-at-sign-up rule. If it does, this brief is revised before build sign-off. The team does not revise it in a pull request.

20. Document control

Version	Date	Author	Change
1.0	30 September 2026	Product & R&D	First issue. Commission for Wave 1, with Wave 2 held as design constraints. Status DRAFT.

Next review: Stage 0 sign-off, or sooner if discovery rejects a persona or a locked decision.

File with: 02_Product_and_RD. Companions: Development Plan v1.0, Decisions_Log_CURRENT_v2, Feature_Register_and_Roadmap v1.2, Lambeth_Pilot_Brief v1.1.

Maintained for THE COMMON COMMUNITY.
